1. Background & Problem Definition
    - Introduce the problem/topic you chose.
    - Explain why it matters (real-world impact, relevance to science/society).
2. Literature Review
    - Summarize existing research, articles, or case studies on the problem.
    - Show what has already been tried or discovered.
    - Cite sources properly
3. Proposed Solution / Theoretical Framework
    - Describe your idea, model, or hypothesis for addressing the problem.
    - This could be:
        - A conceptual model/framework (how variables relate).
        - A research hypothesis (prediction you could test).
        - A design idea inspired by existing solutions.
4. Experimental Design OR Implementation Plan (pick one)
    - If you want to test something: outline how you would design the experiment (participants, variables, procedure, data you'd collect).
    - If it's not testable right now: describe an implementation plan (steps, tools, or methods to explore the solution).
5. References
    - Properly formatted citations of all sources used.
6. (Optional Bonus) Prototype / Diagram / Visualization
    - If you want, include a simple mockup, flowchart, or prototype that supports your idea.
